- Regex: shorthand classes: Instead of specifying all the characters literally, you can use **shorthands** inside character classes: [\w](lowercase) will match any "word character" (letter, numbers and underscore), [\W] (uppercase) will match anything but word characters; similarly, [\d] will match the 0-9 digits while [\D] matches anything but the 0-9 digits, and so on.

### **GIT COMMANDO'S**

- Basis

master: default branch

origin: default upstream repository (remote repository?)

HEAD: current checked out branch/commit

HEAD<sup>^</sup>: parent van HEAD HEAD<sup>^</sup>2: 2e parent van HEAD HEAD<sup>~</sup>4: 4e commit voor HEAD

Repository creëeren

git init git remote add [url]

pull, daarna push ok :p

- Repository die al bestaat clonen git clone [adres] en hierachter nog een leuke naar zoals lekkere dieter :D

Dingen tonen

git status: veranderingen in working directory

git diff: changes to tracked files

git diff \$commit1 \$commit2: veranderingen tussen 2 commits

git log: geschiedenis veranderingen git blame \$file: wie veranderde wat?

git show \$commit

git branch: alle locale branches

- 'Undoen'

git revert HEAD: revert laatste commit, creeert nieuwe commit  $\rightarrow$  met anderen

git reset HEAD: reset laatste commit

git commit -a --amend: laatste commit aanpassen

- Branches

git checkout: switch to branch git branch naam: creeert branch

git checkout -b newbranch ander: creert nieuwe branch gebaseerd op ander

git branch -d naam: delete branch

git branch -f branch1 branch2: pointer branch 1 naar pointer branch2

- Commits aanpassen

git cherry-pick commit: neemt commit en zet hem onder uitgecheckte branch

## git rebase (-i) HEAD~4: i is interactive, neemt de 4 vorige commits

- Remote: updaten

git fetch: laatste veranderingen, geen merge git pull: laatste veranderingen, wel merge git pull -rebase: laatste veranderingen, rebase git pull origin bar:foo pullt bar naar foo

?git pull origin :foo delete foo

## - publish

git rebase --continue

git commit -a: alle lokale veranderingen publiceren git push: veranderingen naar origin pushen git tag commit tag: taggen git describe: omschrijft hoeveel commits van een tag de commit is git push origin foo:bar pusht branch foo naar branch bar in remote ?git push origin :bar delete bar

merge conflicts oplossen

git diff
git diff --base \$file: base file
git diff --ours \$file: jouw veranderingen
git diff --theirs \$file: andere veranderingen
discard conflicting patch
git reset --hard
git rebase --skip
mergen na het oplossen van conflicts:
git add \$file

gaat de groepen verwisselen van plaats, en er telkens hier en daar een nieuwe regel tussen steken.

\_\_\_\_\_

cat sanger.a sanger.c sanger.g sanger.t | sed 's/\(.\)/\1\n/g' | column -c 32 | tr -d '-' | tr -d '\t' | tr -d '\n'

column gaat de regels tellen en verdelen in kolommen.

gebruik sed 's/\n/ /g' om newlines om te zetten in spaties

\_\_\_\_\_

cat getallen.txt | sed "s/\(.\*\)/echo \1\% \\$(cat getallen.txt | head -n1)/" | bash - | bc | tail -n +2 | sed 's/[^0]//' | tr -d '\n' | wc -m

gaat alle getallen uitschrijven door echo, gevolgd door een %, gevolgd door het eerste cijfer. Vervolgens gaat het alles uitvoeren via bash - en het commando bc. Vervolgens gaan we via tail -n +2 het eerste getal verwijderen, omdat dit niet meetelt. Vervolgens gaan we de nullen en new lines verwijderen. Uiteindelijk gaan we dit tellen.

tail -n 2 toont de laatste 2 regels van het bestand

tail -n +2 toont vanaf de 2de regel tot de laatste van het bestand

sed '1d' gaat ook de eerste regel verwijderen, werkt sneller en efficiënter
